# Analysis of the DA PV forecast errors

---

- The analysis is based on the estimates and day-ahead forecast of the PV power generation provided by the German TSOs
- The daily MAE values for Germany have been evaluated over two years (2013-2014)
- The 100 days with the highest errors were identified and the prevailing weather situation manually evaluated by the DWD

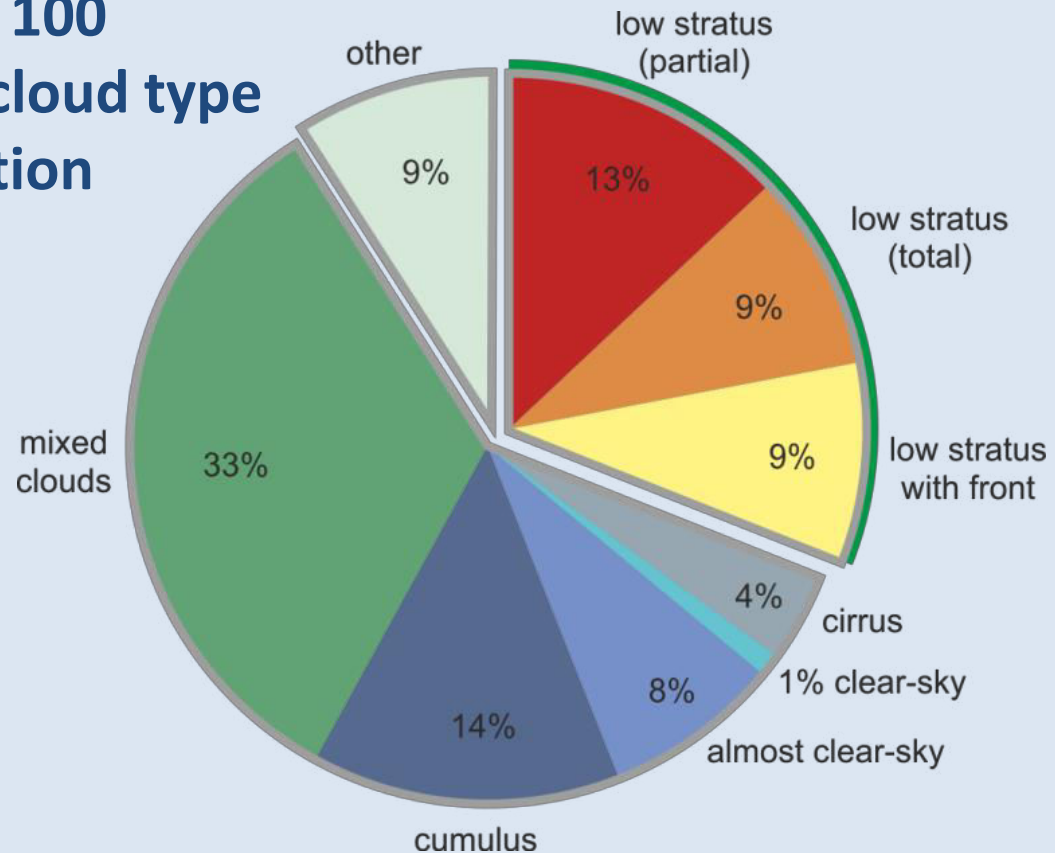

# Analysis of the DA PV forecast errors

# Analysis of the DA PV forecast errors

Distribution of the 100 days according to cloud type and weather situation

→ A large share of the days with large error are marked by the presence of low stratus

# Outline

# Calibration approach

## Choice of the fit function

$$G_{corr} = \left[ \left( a_{11} \tilde{TI} + a_{12} \tilde{SD} + a_{13} \tilde{TI} \cdot \tilde{SD} \right) + \left( a_{21} \tilde{TI} + a_{22} \tilde{SD} + a_{23} \tilde{TI} \cdot \tilde{SD} \right) \left( \frac{G}{G_{TOA}} \right) \right] G_{TOA}$$

$$\text{with } \tilde{SD} = \max[0, (SD_0 - SD)] \quad \tilde{TI} = \max[0, (TI - TI_0)]$$

G	irradiance forecast [W/m <sup>2</sup> ]
G <sub>corr</sub>	corrected irradiance forecast [W/m <sup>2</sup> ]
G <sub>poa</sub>	extraterrestrial irradiance [W/m <sup>2</sup> ]
TI	max temperature inversion below 800 hPa [°C]
TI <sub>0</sub>	TI above which the correction scheme is activated [°C]
SD	saturation deficit below the temperature inversion [kg/kg]
SD <sub>0</sub>	SD below which the correction scheme is activated [kg/kg]
a <sub>ij</sub>	calibration coefficients

# Calibration approach

## Choice of the fit function

$$G_{corr} = \left[ \left( a_{11} \tilde{TI} + a_{12} \tilde{SD} + a_{13} \tilde{TI} \cdot \tilde{SD} \right) + \left( a_{21} \tilde{TI} + a_{22} \tilde{SD} + a_{23} \tilde{TI} \cdot \tilde{SD} \right) \left( \frac{G}{G_{TOA}} \right) \right] G_{TOA}$$

with

$$\tilde{SD} = \max[0, (SD_0 - SD)]$$

$$\tilde{TI} = \max[0, (TI - TI_0)]$$

**Activation of the correction scheme for  $TI > TI_0$  &  $SD < SD_0$**

G	irradiance forecast [W/m <sup>2</sup> ]
G <sub>corr</sub>	corrected irradiance forecast [W/m <sup>2</sup> ]
G <sub>poa</sub>	extraterrestrial irradiance [W/m <sup>2</sup> ]
TI	max temperature inversion below 800 hPa [°C]
TI <sub>0</sub>	TI above which the correction scheme is activated [°C]
SD	saturation deficit below the temperature inversion [kg/kg]
SD <sub>0</sub>	SD below which the correction scheme is activated [kg/kg]
a <sub>ij</sub>	calibration coefficients

# Calibration approach

## Choice of the fit function

## Different corrections coefficients for clear sky and overcast sky

$$G_{corr} = \left[ \left( a_{11} \tilde{TI} + a_{12} \tilde{SD} + a_{13} \tilde{TI} \cdot \tilde{SD} \right) + \left( a_{21} \tilde{TI} + a_{22} \tilde{SD} + a_{23} \tilde{TI} \cdot \tilde{SD} \right) \left( \frac{G}{G_{TOA}} \right) \right] G_{TOA}$$

$$\text{with } \tilde{SD} = \max[0, (SD_0 - SD)] \quad \tilde{TI} = \max[0, (TI - TI_0)]$$

G	irradiance forecast [W/m <sup>2</sup> ]
G <sub>corr</sub>	corrected irradiance forecast [W/m <sup>2</sup> ]
G <sub>poa</sub>	extraterrestrial irradiance [W/m <sup>2</sup> ]
TI	max temperature inversion below 800 hPa [°C]
TI <sub>0</sub>	TI above which the correction scheme is activated [°C]
SD	saturation deficit below the temperature inversion [kg/kg]
SD <sub>0</sub>	SD below which the correction scheme is activated [kg/kg]
a <sub>ij</sub>	calibration coefficients

# Calibration approach

## Choice of the fit function

## Simple additive model with a cross term

$$G_{corr} = \left[ \left( a_{11}\tilde{TI} + a_{12}\tilde{SD} + a_{13}\tilde{TI} \cdot \tilde{SD} \right) + \left( a_{21}\tilde{TI} + a_{22}\tilde{SD} + a_{23}\tilde{TI} \cdot \tilde{SD} \right) \left( \frac{G}{G_{TOA}} \right) \right] G_{TOA}$$

$$\text{with } \tilde{SD} = \max[0, (SD_0 - SD)] \quad \tilde{TI} = \max[0, (TI - TI_0)]$$

G	irradiance forecast [W/m <sup>2</sup> ]
G <sub>corr</sub>	corrected irradiance forecast [W/m <sup>2</sup> ]
G <sub>poa</sub>	extraterrestrial irradiance [W/m <sup>2</sup> ]
TI	max temperature inversion below 800 hPa [°C]
TI <sub>0</sub>	TI above which the correction scheme is activated [°C]
SD	saturation deficit below the temperature inversion [kg/kg]
SD <sub>0</sub>	SD below which the correction scheme is activated [kg/kg]
a <sub>ij</sub>	calibration coefficients

# Calibration approach

## Choice of the fit function

$$G_{corr} = \left[ \left( a_{11} \tilde{TI} + a_{12} \tilde{SD} + a_{13} \tilde{TI} \cdot \tilde{SD} \right) + \left( a_{21} \tilde{TI} + a_{22} \tilde{SD} + a_{23} \tilde{TI} \cdot \tilde{SD} \right) \left( \frac{G}{G_{TOA}} \right) \right] G_{TOA}$$

$$\text{with } \tilde{SD} = \max[0, (SD_0 - SD)] \quad \tilde{TI} = \max[0, (TI - TI_0)]$$

G	irradiance forecast [W/m <sup>2</sup> ]
G <sub>corr</sub>	corrected irradiance forecast [W/m <sup>2</sup> ]
G <sub>poa</sub>	extraterrestrial irradiance [W/m <sup>2</sup> ]
TI	max temperature inversion below 800 hPa [°C]
TI <sub>0</sub>	TI above which the correction scheme is activated [°C]
SD	saturation deficit below the temperature inversion [kg/kg]
SD <sub>0</sub>	SD below which the correction scheme is activated [kg/kg]
a <sub>ij</sub>	calibration coefficients

**Coefficients are  
assumed constant  
in time and space**

# Calibration approach

- The calibration is evaluated for the south of Germany
- Satellite-derived irradiance (HC3v4) and IFS forecast are used
- The coefficients  $a_{ij}$  are evaluated by a multiple linear regression
- The correction is evaluated for the time period 01/2015 –06/2015
- The effect of the calibration is assessed for the time period 07/2015-12/2012

# Outline

---

- 1) Analysis of the day-ahead PV power forecast error
- 2) Example of a day marked by low stratus

# Results

- Correction scheme activated for 172 from 2046 time steps
- When the correction scheme is activated, RMSE: 56.2 -> 38.4 W/m<sup>2</sup>
- For the complete test data set, RMSE: 58.3 -> 57.0 W/m<sup>2</sup>

# Outline
