Abstract

Novel bi- and tridentate ligands with phosphane and thioether moieties have been prepared in enantiomerically pure form in good to excellent yields by substitution reactions with phosphorus and sulfur nucleophiles of easily available tosylates derived from natural chiral α-hydroxy acids. © 1999 Elsevier Science Ltd. All rights reserved.

1. Introduction

We are interested in the development of new chiral multidentate ligands,1,2 e.g. tridentate ligands of the general type 1 and bidentate ligands 2 (Scheme 1) with different donor moieties, such as phosphane and thioether groups, for transition metal catalyzed asymmetric C–C bond formations, with special interest in the transition metal catalyzed asymmetric Michael reaction.3

In this paper we report in continuation of our previous work1 the synthesis of three new enantiomerically pure C2-symmetric tridentate ligands with P,O,P- and S,O,S-donor sets (1a–1c) and an improved route to the enantiopure hydroxyalkyl phosphanes and thioethers 2a–2f (Scheme 1). The hydroxy compounds 2a–2f have already been prepared in racemic form as well as — in some cases — enantiopure materials by either epoxide opening or substitution of hydroxy alkyl halides with phosphorus or sulfur nucleophiles.4–10 The route we present herein is an improvement on the reported procedures, since regioselectivity problems in epoxide opening reactions or stereoselectivity problems in the introduction of chirality by an asymmetric reaction are avoided. In our approach the stereo information is derived from natural, non-racemic α-hydroxy acids. Unlike 1a–1c, secondary alcohols 2a–2f can not only be applied as chiral ligands, but play an important role as enantiopure building blocks or chiral auxiliaries.

2. Synthesis

The synthesis of the tridentate ligands 1a–1c starts from the recently published diol 3 (Scheme 2), which is easily prepared from (5)-(−)-ethyl lactate. Compound 3 is tosylated with TosCl in pyridine to give the bistosylate 4 in 51% yield. Intermediate 4 can be easily substituted by KPPh₂ in DMF/THF or NaSR in DMF to give compounds 1a–1c in good to excellent yields with an inversion of configuration (Table 1). It is important to mention that by NMR or GC no other diastereoisomers of 1a–1c are detectable, which means that the substitution is stereospecific and no epimerization takes place. The ¹³C spectrum of 1a shows the expected phosphorus coupling and that the two Ph groups of each Ph₂P moiety are diastereotopic.

It is remarkable, that — in our hands — bisphosphane 1a shows only a very low tendency to oxidize in air at room temperature, although at elevated temperatures, especially in solution, formation of phosphan oxide is detectable by $^{31}$P NMR.

The hydroxyalkyl phosphanes 2a and 2b and thioethers 2c–2f have been prepared from the corresponding hydroxy tosylates 5a and 5b (Scheme 2), which are derived in enantiomerically pure form from (S)-(−)-ethyl lactate and (S)-(−)-ethyl mandelate. Substitution with KPPh₂ in DMF/THF or NaSR in DMF proceeds in high yields (Table 1). In the case of the phosphanes 2a and 2b all expected phosphorus couplings are observed in the NMR spectra. Moreover, the Ph groups of the Ph₂P moieties appear to be

Although there are already syntheses of compounds 2 reported in the literature, the presented route is superior to the others: the regioselectivity problem of the epoxide opening is avoided as well as the need for an asymmetric reaction to build up the stereogenic center, because the stereo information is derived from the chiral pool.

3. Asymmetric Michael reactions

Recently, Shibasaki has introduced an excellent heterobimetallic catalyst for the Michael reaction of β-dicarbonyl compounds with α,β-unsaturated ketones.\textsuperscript{11,12} However, the reaction conditions are strongly basic, thus often causing a number of unwanted side- and subsequent processes. The need for a neutral transition metal catalyst has been — more or less successfully — addressed by a number of groups in the past years.\textsuperscript{13–17} As our contribution to this topic we screened all nine ligands 1a–1c and 2a–2f with 12 metal salts\textsuperscript{†} (which we knew would catalyze the Michael reaction, shown in Scheme 3, at least to some extent at room temperature) in a combinatorial approach: separately, 108 (9 ligands×12 metal salts) catalytic systems were formed in situ and screened for enantioselectivity in the catalysis of the Michael reaction of oxoester 6 with methyl vinyl ketone 7 (Scheme 3). Analysis of the product 8 was performed by chiral GC. Details are given in the experimental section. Unfortunately, in none of our experiments was an enantioselectivity of more than 10% ee detectable.

\textsuperscript{†} List of applied metal salts: CrCl\textsubscript{3}·6H\textsubscript{2}O, Mn(OAc)\textsubscript{2}·4H\textsubscript{2}O, FeCl\textsubscript{3}·6H\textsubscript{2}O, Ni(OAc)\textsubscript{2}·4H\textsubscript{2}O, NiCl\textsubscript{2}·6H\textsubscript{2}O, CoCl\textsubscript{2}·6H\textsubscript{2}O, RhCl\textsubscript{3}·3H\textsubscript{2}O, Cu(OAc)\textsubscript{2}·H\textsubscript{2}O, AgOAc, ZnCl\textsubscript{2}, SnCl\textsubscript{2}, Pb(OAc)\textsubscript{2}·3H\textsubscript{2}O.
4. Summary

Three new chiral tridentate ligands with $P,O,P$- and $S,O,S$-donor sets and six enantiopure hydroxyethyl phosphanes and thioethers have been prepared from commercially available natural chiral $\alpha$-hydroxy acids and tested as ligands in the asymmetric catalysis of the Michael reaction.

5. Experimental

5.1. General

Column chromatography was accomplished with Merck silica gel (Type 60, 0.063–0.200 mm). $^1$H NMR spectra were recorded on a Bruker AM 400 (400 MHz), and reported in parts per million (ppm) using the residual proton solvent peak of CDCl$_3$ at 7.26 ppm as an internal standard, with coupling constants (J) in hertz (Hz). $^{13}$C NMR spectra were recorded on a Bruker AC 200 (50 MHz, $^1$H decoupled), and reported in parts per million (ppm) using the solvent triplet of CDCl$_3$ at 77.0 ppm as an internal standard. Assignments were made using DEPT experiments. $^{31}$P NMR spectra were recorded on a Bruker AC 200 (80 MHz) using PPh$_3$ (−6 ppm) in CDCl$_3$ as an external standard. MS spectra were obtained with Varian MAT 711 and MAT 955Q (high resolution) instruments. IR spectra were recorded on a Nicolet Magna IR 750. Elemental analyses were obtained with an Analytik Jena Vario EL. Optical rotations were measured with a Perkin–Elmer polarimeter 341. Chiral GC analysis was performed on a Packard 437A with FI detection, a Shimadzu C-R6A integrator and a Macherey–Nagel column FS-LIPODEX E (25 m, 0.25 mm) with nitrogen carrier gas.

Starting compounds 3, 5a and 5b were synthesized according to literature procedures.$^1$ DMF (HPLC grade), NaSEt (90% technical quality), NaSPh (90% technical quality) and KPPh$_2$ (0.5 M solution in THF) were purchased from the Aldrich Chemical Co. and used as received.

5.2. Abbreviations

ATR: attenuated total reflection; MTB: tert-butyl methyl ether; Tos: $p$-tolylsulfanyl.

5.3. (S,S)-(−)-Bis[2-(p-tolylsulfonyloxy)propyl]ether 4

TosCl (1.49 g, 7.80 mmol) was added to a solution of the diol 3 (262 mg, 1.95 mmol) in pyridine (1.5 ml), and stirred overnight at room temperature. Water (10 ml) and CH$_2$Cl$_2$ (10 ml) were added, and the mixture was stirred for 30 min. The layers were separated, and the aqueous layer was extracted three times with CH$_2$Cl$_2$ (each 30 ml). The combined organic layers were washed with hydrochloric acid (18%, 50 ml), water (50 ml) and brine (50 ml). The solution was dried over MgSO$_4$, evaporated, and the crude product was chromatographed (SiO$_2$, MTB:hexane 1:1, $R_f=0.29$) to give compound 4 (442 mg, 0.999 mmol, 51%) as a colorless oil. $[\alpha]_D^{20}=-9.9$ (c 11.3, CHCl$_3$). $^1$H NMR (400 MHz, CDCl$_3$): δ 1.19 (6H, d, J=6.5 Hz), 2.44 (6H, s), 3.32 (2H, dd, J=4.4 Hz, J=10.8 Hz), 3.41 (2H, dd, J=5.7 Hz, J=10.8 Hz), 4.53–4.63 (2H, m), 7.30–7.35 (4H, m), 7.74–7.79 (4H, m). $^{13}$C NMR (50 MHz, CDCl$_3$): δ 17.44 (2 CH$_3$), 21.59 (2 CH$_3$), 73.47 (2 CH$_2$), 77.79 (2 CH), 127.73 (4 CH), 129.73 (4 CH), 134.25 (2 C), 144.60 (2 C). 5.9. (S)-(+-)-Ethyl-(2-hydroxy-1-propyl)thioether 2c

Attention: Due to the high volatility of the product 2c all evaporation processes should be done carefully. A solution of the tosylate 5a (461 mg, 2.00 mmol) in DMF (3 ml) was added to NaSEt (336 mg, 4.00 mmol), and stirred overnight at room temperature in a tightly closed reaction flask, and diluted with MTB (75 ml). The mixture was washed twice with water (each 50 ml), dried over MgSO$_4$, and evaporated to dryness. The crude product was chromatographed (SiO$_2$, MTB:hexane 1:1, $R_f=0.31$) to give compound 2c (194 mg, 1.61 mmol, 81%) as a yellowish oil. $\delta$ D$_2$O $+78.7$ (c 13.8, CHCl$_3$). 1H NMR (400 MHz, CDCl$_3$): 1.25 (3H, d, J=6.2 Hz), 1.27 (3H, t, J=7.4 Hz), 2.44 (1H, dd, J=9.0 Hz, J=13.7 Hz), 2.56 (2H, q, J=7.4 Hz), 2.57 (1H, br s), 2.74 (1H, dd, J=3.5 Hz, J=13.7 Hz), 3.78–3.88 (1H, m). 13C NMR (50 MHz, CDCl$_3$): 14.59 (CH$_3$), 21.77 (CH$_3$), 25.89 (CH$_2$), 40.82 (CH$_2$), 65.39 (CH). IR (ATR): 3396 (s), 2970 (s), 2926 (vs), 2875 (m), 2855 (m), 1733 (m), 1496 (w), 1454 (m), 1375 (m), 1355 (w), 1266 (m), 1205 (w), 1177 (m), 1129 (m), 1079 (s), 1059 (s), 1029 (m), 938 (w), 730 (w), 702 (w). MS (EI, 70 eV) $m/z$ (%)=120 (100), 105 (11), 77 (13), 76 (81), 75 (41), 61 (57), 59 (17). HRMS: Mol. mass calcd 120.0609 (for C$_5$H$_{12}$OS), found 120.0610 (M$^+$).

5.10. (S)-(+-)-(2-Hydroxy-1-propyl)-phenyl thioether 2d

A solution of the tosylate 5a (461 mg, 2.00 mmol) in DMF (3 ml) was added to NaSPh (529 mg, 4.00 mmol), stirred overnight at room temperature in a tightly closed reaction flask, and diluted with MTB (75 ml). The mixture was washed twice with water (each 50 ml), dried over MgSO$_4$, and evaporated to dryness. The crude product was chromatographed (SiO$_2$, MTB:hexane 1:1, $R_f=0.40$) to give compound 2d (302 mg, 1.79 mmol, 90%) as a yellowish oil. $\delta$ D$_2$O $+60.1$ [c 12.2, CHCl$_3$; lit. $+54.7$, c 1, CHCl$_3$]. 1H NMR (400 MHz, CDCl$_3$): 1.27 (3H, d, J=6.2 Hz), 2.33 (1H, br s), 2.84 (1H, dd, J=8.6 Hz, J=13.7 Hz), 3.12 (1H, dd, J=3.6 Hz, J=13.7 Hz), 3.80–3.89 (1H, m), 7.18–7.41 (5H, m). 13C NMR (50 MHz, CDCl$_3$): 21.83 (CH$_3$), 43.28 (CH$_2$), 65.54 (CH), 126.39 (CH), 128.90 (2 CH), 129.81 (2 CH), 135.26 (C). IR (ATR): 3378 (s), 3075 (w), 3058 (w), 2970 (m), 2918 (w), 1584 (m), 1480 (m), 1438 (m), 1409 (w), 1372 (w), 1302 (w), 1249 (w), 1239 (w), 1186 (w), 1123 (m), 1068 (m), 1036 (m), 1025 (s), 934 (m), 874 (w), 816 (w), 736 (vs), 689 (vs). MS (EI, 70 eV) m/z (%)=168 (72), 135 (4), 124 (100), 123 (36), 110 (15), 109 (20), 91 (31), 78 (26), 65 (10), 51 (14). HRMS: Mol. mass calcd 168.0609 (for C$_9$H$_{12}$OS), found 168.0612 (M$^+$).

5.11. (S)-(+-)-Ethyl-(2-hydroxy-2-phenyl-1-ethyl)thioether 2e

A solution of the tosylate 5b (585 mg, 2.00 mmol) in DMF (3 ml) was added to NaSEt (336 mg, 4.00 mmol), stirred overnight at room temperature in a tightly closed reaction flask, and diluted with MTB (75 ml). The mixture was washed twice with water (each 50 ml), dried over MgSO$_4$, and evaporated to dryness. The crude product was chromatographed (SiO$_2$, MTB:hexane 1:2, $R_f=0.38$) to give compound 2e (313 mg, 1.72 mmol, 86%) as a yellowish oil. $\delta$ D$_2$O $+81$ [c 6.4, CHCl$_3$; lit. $-75.8$ for (R)-2e, c 2.19, CHCl$_3$]. 1H NMR (400 MHz, CDCl$_3$): $\delta$ 1.28 (3H, t, J=7.4 Hz), 2.58 (2H, q, J=7.4 Hz), 2.73 (1H, dd, J=9.6 Hz, J=13.8 Hz), 2.95 (1H, dd, J=3.6 Hz, J=13.8 Hz), 3.03 (1H, br s), 4.71–4.77 (1H, m), 7.25–7.41 (5H, m). 13C NMR (50 MHz, CDCl$_3$): $\delta$ 14.51 (CH$_3$), 25.81 (CH$_2$), 41.12 (CH$_2$), 71.65 (CH), 125.56 (2
CH), 127.46 (CH), 128.14 (2 CH), 142.48 (C). IR (ATR): 3423 (vs), 3085 (w), 3062 (w), 3029 (w), 2925 (m), 2871 (w), 1952 (w), 1882 (w), 1809 (w), 1756 (w), 1602 (w), 1493 (m), 1453 (s), 1409 (m), 1376 (m), 1332 (w), 1266 (m), 1231 (w), 1194 (m), 1081 (w), 1058 (s), 1028 (s), 1002 (w), 980 (m), 915 (w), 860 (w), 769 (m), 758 (m), 730 (s), 699 (vs). MS (EI, 70 eV) m/z = 182 (4), 107 (58), 91 (100), 79 (44), 77 (31), 76 (100), 61 (11). HRMS: Mol. mass calc 182.0765 (for C₁₀H₁₄OS), found 182.0761 (M⁺). Anal. calc for C₁₀H₁₄OS (182.29): C 65.89, H 7.74, found C 65.58, H 7.90.

5.12. (S)-(−)-(2-Hydroxy-2-phenyl-1-ethyl)-phenyl thioether 2f

A solution of the tosylate 5b (585 mg, 2.00 mmol) in DMF (3 ml) was added to NaSPh (529 mg, 4.00 mmol), stirred overnight at room temperature in a tightly closed reaction flask, and diluted with MTB (75 ml). The mixture was washed twice with water (each 50 ml), dried over MgSO₄, and evaporated to dryness. The crude product was chromatographed (SiO₂, MTB:hexane 1:3, Rf = 0.35) to give compound 2f (420 mg, 1.82 mmol, 91%) as a yellowish oil. [α]D²⁰ = −12.5 [c 13.9, CHCl₃; lit.¹⁰ +8.6 for (R)-2f, c 1.07, CHCl₃]. ¹H NMR (400 MHz, CDCl₃): δ 2.85 (1H, br s), 3.10 (1H, dd, J=9.5 Hz, J=13.8 Hz), 3.34 (1H, dd, J=3.4 Hz, J=13.8 Hz), 4.73 (1H, dd, J=3.4 Hz, J=9.5 Hz), 7.21–7.46 (10H, m). ¹³C NMR (50 MHz, CDCl₃): δ 43.75 (CH₂), 71.61 (CH), 125.76 (2 CH), 126.59 (CH), 127.85 (CH), 128.42 (2 CH), 129.00 (2 CH), 130.00 (2 CH), 134.93 (C), 142.09 (C). IR (ATR): 3394 (s), 3059 (w), 3029 (w), 3003 (w), 2919 (w), 2886 (w), 1601 (w), 1582 (m), 1493 (w), 1480 (m), 1453 (m), 1438 (m), 1408 (w), 1332 (w), 1302 (w), 1230 (w), 1192 (w), 1156 (w), 1086 (w), 1053 (m), 1025 (s), 1001 (w), 989 (w), 914 (w), 858 (w), 768 (w), 737 (vs), 698 (vs), 689 (vs). MS (EI, 70 eV) m/z = 230 (9), 124 (100), 107 (29), 91 (8), 79 (21), 77 (15), 65 (3), 51 (7). HRMS: Mol. mass calc 230.0765 (for C₁₄H₁₄OS), found 230.0763 (M⁺). Anal. calc for C₁₄H₁₄OS (230.33): C 73.01, H 6.13, found C 73.12, H 6.25.

5.13. Asymmetric catalysis: ethyl 2-(3-oxobutyl)cyclopentanone-2-carboxylate 8

Metal compound (0.05 mmol, 5 mol%), chiral ligand 1 (0.075 mmol, 7.5 mol%) or 2 (0.1 mmol, 10 mol%) and oxoester 6 (156 mg, 1.0 mmol) were dissolved in CH₂Cl₂ (1 ml). After stirring for 1 h at room temperature methyl vinyl ketone 7 (84 mg, 1.2 mmol) was added and the mixture was stirred overnight at room temperature. Subsequently, all volatile materials were removed in vacuo and the residue was filtered through SiO₂ (MTB:hexane 1:1, Rf=0.25). The product mixture was analyzed by chiral GC, isothermal elution (130°C).
